

## Module 26

- Pumping Lemma
  - A technique for proving a language L is NOT regular
  - What does the Pumping Lemma mean?
  - Proof of Pumping Lemma

1

## Pumping Lemma

How do we use it?

2

## Pumping Condition

- A language L satisfies the pumping condition if:
  - there exists an integer  $n > 0$  such that
  - for all strings x in L of length at least n
  - there exist strings u, v, w such that
    - $x = uvw$  and
    - $|uv| \leq n$  and
    - $|v| \geq 1$  and
    - For all  $k \geq 0$ ,  $uv^k w$  is in L

3

## Pumping Lemma

- All regular languages satisfy the pumping condition

4

## Implications \*

- We can use the pumping lemma to prove a language L is not regular
  - How?
- We cannot use the pumping lemma to prove a language is regular
  - How might we try to use the pumping lemma to prove that a language L is regular and why does it fail?

5

## Pumping Lemma

What does it mean?

6

## Pumping Condition

- A language  $L$  satisfies the pumping condition if:
  - there exists an integer  $n > 0$  such that
  - for all strings  $x$  in  $L$  of length at least  $n$
  - there exist strings  $u, v, w$  such that
    - $x = uvw$  and
    - $|uv| \leq n$  and
    - $|v| \geq 1$  and
    - For all  $k \geq 0$ ,  $uv^k w$  is in  $L$

7

## $v$ can be pumped

- $x$  in  $L$
- $x = uvw$
- For all  $k \geq 0$ ,  $uv^k w$  is in  $L$

- Let  $x = abcdefg$  be in  $L$
- Then there exists a substring  $v$  in  $x$  such that  $v$  can be repeated (pumped) in place any number of times and the resulting string is still in  $L$ 
  - $uv^k w$  is in  $L$  for all  $k \geq 0$
- For example
  - $v = cde$ 
    - $uv^0 w = uw = abfg$  is in  $L$
    - $uv^1 w = uvw = abcdefg$  is in  $L$
    - $uv^2 w = uvvw = abcdecdefg$  is in  $L$
    - $uv^3 w = uvvww = abcdecdecdefg$  is in  $L$
    - ...

8

## What the other parts mean

- A language  $L$  satisfies the pumping condition if:
  - there exists an integer  $n > 0$  such that
    - defer what  $n$  is till later
  - for all strings  $x$  in  $L$  of length at least  $n$ 
    - $x$  must be in  $L$  and have sufficient length
  - there exist strings  $u, v, w$  such that
    - $x = uvw$  and
    - $|uv| \leq n$  and
      - $v$  occurs in the first  $n$  characters of  $x$
    - $|v| \geq 1$  and
      - $v$  is not  $\Lambda$
  - For all  $k \geq 0$ ,  $uv^k w$  is in  $L$

9

## Examples \*

- Example 1
  - Let  $L$  be the set of even length strings over  $\{a, b\}$
  - Let  $x = abaa$
  - Let  $n = 2$
  - What are the possibilities for  $v$ ?
    - $abaa, abaa$
    - $abaa$
  - Which one satisfies the pumping lemma?

10

## Examples \*

- Example 2
  - Let  $L$  be the set of strings over  $\{a, b\}$  where the number of  $a$ 's mod 3 is 1
  - Let  $x = abbbaa$
  - Let  $n = 3$
  - What are the possibilities for  $v$ ?
    - $abbbaa, abbbaa, abbbaa$
    - $abbbaa, abbbaa$
    - $abbbaa$
  - Which ones satisfy the pumping lemma?

11

## Pumping Lemma

Proof

12

## High Level Outline

- Let  $L$  be an arbitrary regular language
- Let  $M$  be an FSA such that  $L(M) = L$ 
  - $M$  exists by definition of LFSA and the fact that regular languages and LFSA are identical
- *Show that  $L$  satisfies the pumping condition*
  - Use  $M$  in this part
- Pumping Lemma follows

13

## First step: $n+1$ prefixes of $x$

- Let  $n$  be the number of states in  $M$
- Let  $x$  be an arbitrary string in  $L$  of length at least  $n$ 
  - Let  $x_i$  denote the  $i$ th character of string  $x$
- There are at least  $n+1$  distinct prefixes of  $x$ 
  - length 0:  $\lambda$
  - length 1:  $x_1$
  - length 2:  $x_1x_2$
  - ...
  - length  $i$ :  $x_1x_2 \dots x_i$
  - ...
  - length  $n$ :  $x_1x_2 \dots x_1 \dots x_n$

14

## Example

- Let  $n = 8$
- Let  $x = abcdefgh$
- There are 9 distinct prefixes of  $x$ 
  - length 0:  $\lambda$
  - length 1:  $a$
  - length 2:  $ab$
  - ...
  - length 8:  $abcdefgh$

15

## Second step: Pigeon-hole Principle

- As  $M$  processes string  $x$ , it processes each prefix of  $x$ 
  - In particular, each prefix of  $x$  must end up in some state of  $M$
- Situation
  - There are  $n+1$  distinct prefixes of  $x$
  - There are only  $n$  states in  $M$
- Conclusion
  - At least two prefixes of  $x$  must end up in the same state of  $M$ 
    - Pigeon-hole principle
  - Name these two prefixes  $p_1$  and  $p_2$

16

## Third step: Forming $u, v, w$

- Setting:
  - Prefix  $p_1$  has length  $i$
  - Prefix  $p_2$  has length  $j > i$ 
    - prefix  $p_1$  of length  $i$ :  $x_1x_2 \dots x_i$
    - prefix  $p_2$  of length  $j$ :  $x_1x_2 \dots x_i x_{i+1} \dots x_j$
- Forming  $u, v, w$ 
  - Set  $u = p_1 = x_1x_2 \dots x_i$
  - Set  $v = x_{i+1} \dots x_j$
  - Set  $w = x_{j+1} \dots x_{|x|}$
  - $x_1x_2 \dots x_i x_{i+1} \dots x_j x_{j+1} \dots x_{|x|}$

u v w

17

## Example 1 \*

- Let  $M$  be a 5-state FSA that accepts all strings over  $\{a,b,c,\dots,z\}$  whose length mod 5 = 3
- Consider  $x = abcdefghijklmnopqr$ , a string in  $L$
- What are the two prefixes  $p_1$  and  $p_2$ ?
- What are  $u, v, w$ ?

18

## Example 2 \*

- Let  $M$  be a 3-state FSA that accepts all strings over  $\{0,1\}$  whose binary value mod  $3 = 1$
- Consider  $x = 10011$ , a string in  $L$
- What are the two prefixes  $p_1$  and  $p_2$ ?
- What are  $u$ ,  $v$ ,  $w$ ?

19

## Fourth step: Showing $u$ , $v$ , $w$ satisfy all the conditions

- $|uv| \leq n$ 
  - $uv = p_2$
  - $p_2$  is one of the first  $n+1$  prefixes of string  $x$
- $|v| \geq 1$ 
  - $v$  consists of the characters in  $p_2$  after  $p_1$
  - Since  $p_2$  and  $p_1$  are distinct prefixes of  $x$ ,  $v$  is not  $\lambda$
- For all  $k \geq 0$ ,  $uv^k w$  in  $L$ 
  - $u=p_1$  and  $uv=p_2$  end up in the same state  $q$  of  $M$ 
    - This is how we defined  $p_1$  and  $p_2$
  - Thus for all  $k \geq 0$ ,  $uv^k$  ends up in state  $q$
  - The string  $w$  causes  $M$  to go from state  $q$  to an accepting state

20

## Example 1 again

- Let  $M$  be a 5-state FSA that accepts all strings over  $\{a,b,c,\dots,z\}$  whose length mod  $5 = 3$
- Consider  $x = abcdefghijklmnopqr$ , a string in  $L$
- What are  $u$ ,  $v$ ,  $w$ ?
  - $u = \lambda$
  - $v = abcde$
  - $w = fghijklmnopqr$
- $|uv| = 5 \leq 5$
- $|v| = 5 \geq 1$
- For all  $t \geq 0$ ,  $(abcde)^t fghijklmnopqr$  is in  $L$

21

## Example 2 again

- Let  $M$  be a 3-state FSA that accepts all strings over  $\{0,1\}$  whose binary interpretation mod  $3 = 1$
- Consider  $x = 10011$ , a string in  $L$
- What are  $u$ ,  $v$ ,  $w$ ?
  - $u = 1$
  - $v = 00$
  - $w = 11$
- $|uv| = 3 \leq 3$
- $|v| = 2 \geq 1$
- For all  $k \geq 0$ ,  $1(00)^k 11$  is in  $L$

22

## Pumping Lemma

- A language  $L$  satisfies the pumping condition if:
  - there exists an integer  $n > 0$  such that
  - for all strings  $x$  in  $L$  of length at least  $n$
  - there exist strings  $u$ ,  $v$ ,  $w$  such that
    - $x = uvw$  and
    - $|uv| \leq n$  and
    - $|v| \geq 1$  and
    - For all  $k \geq 0$ ,  $uv^k w$  is in  $L$
- Pumping Lemma: All regular languages satisfy the pumping condition

23
