BANKING APP USE CASE

Problem statement:

Consider a banking app that a customer and the bank can perform various operations. Customers of the bank first authenticate their identity to use the system. The system verifies password and if the password is wrong, displays an error message. Customers can check their balance. To transfer funds and to make payment, the system must verify if there is sufficient amount of balance in the account. Payment can be made in two ways:

1) the customer can pay from the savings or
2) pay from checking.

Customers can also set up their profile. If the customers click help link, the system shows "profile help" page. If the customer wants to display privacy information, the system shows "privacy information". The bank can also Check balance, transfer funds or make payments on behalf of the customer.
